

06/03/09 - GSoC, week 2: ongoing important changes

A brief note, just because lots of things changed during this weekend (this long weekend, two days of holidays here in Italy): I have dropped the metadata model that I started last week, because the annotation plugin already had one, and a couple of hours ago I also dropped the SuggestionProvider plugin system.

Recent annotations will be implemented through an AnnotationPlugin subclass, and related annotations will be provided with an utility class, probably later on.

Still working on save dialog UI, though, and I'm trying to add views in a KFileDialog subclass: task which seems not so easy (any advice?), some functioning code will shortly come, I promise!
